

Decision Matrix

		Option A	Option B	Option C	Option D
Property	%Weight				
Total	100%				

Fill in the Property Column: List the properties relevant to your project (e.g., strength, weight, cost, etc.)

Assign Weights: Determine how important each property is to your project and assign a weight (e.g., 1–5).

Rate Options: Research and assign a rating (1–5) for each option based on how well it satisfies the property.

Calculate Scores: Multiply the weight by the rating for each property and sum the total for each option.

Compare Scores: The option with the highest total score is likely the best choice.
